A Digital Workspace Security Assessment from Citrix Consulting Services evaluates key aspects of the Citrix environment to reduce your overall security exposure. Our multi-disciplinary team of security, workspace delivery and networking experts will evaluate users, apps, data and more to identify vulnerabilities, analyze risk and make recommendations to protect your digital workspace and ensure business continuity.

**Raising the security stakes**

Amidst rapid evolution of cyber threats, it is more important than ever to optimize your Citrix environment for secure delivery of apps and data. IT forces including cloud transition, the proliferation of mobile devices and apps, shadow IT, and even the increase of users with greater access to the corporate network are all raising the security stakes.

Citrix simplifies the security model by transitioning from point solution and device specific security to a centralized secure delivery framework. To ensure that you are maximizing the level of protection that your Citrix solution provides, we recommend an expert, comprehensive evaluation of your environment: the Digital Workspace Security Assessment.

Delivered through our Security Practice, the Digital Workspace Security Assessment is an onsite engagement that evaluates all layers of your Citrix environment in order to provide recommendations for optimizing the following:

- **Contextual Access** – Focus areas will include user personas, role based access, segmentation and endpoint control.
- **Network Security** – Physical, appliance, networking and operational layers are examined including traffic encryption, packet inspection, addressing and routing and DoS protection.
- **Application Security** – Focus areas include application delivery, centralization, policy lockdowns, containment and isolation, web app protection and secure browser configuration.
- **Data Security** – Factors examined include data sharing and mechanisms used to protect data in transit and at rest including data hosting, file link expiration and data wipe procedures.
- **Insights & Analytics** – Operational security factors assessed include monitoring, event logging/auditing, anomaly detection and delegated administration.
Engage the experts

The Digital Workspace Security Assessment serves as the initial stage of a comprehensive security strategy. Building upon this evaluation, our Security Practice offers other engagements and solutions that can help you improve the security of apps, data, browsers and file sharing, in addition to enhancing network control, comprehensive monitoring, and attack prevention.

Contact your Citrix representative to find out how a Digital Workspace Security Assessment from Citrix Consulting Services can help you prepare to thwart attacks, minimize risk and increase protection across your infrastructure.

Why choose Citrix Consulting?

Citrix Consulting is uniquely qualified to assess the security of your Citrix environment. We use our extensive knowledge and experience in secure delivery of applications and data to help customers harden their Citrix environment, reducing your overall attack surface and carefully balancing risk management with end-user productivity.

Benefits for your organization

• **Proactive approach:** Instead of waiting for threats to emerge, this engagement empowers you to take the initiative in understanding and addressing critical focus areas. Citrix Consulting will pinpoint potential exposures and offer suggestions for strengthening your security posture to prevent or minimize attacks.

• **Comprehensive scope:** This assessment spans all aspects of your Citrix environment to provide a holistic view of risks, vulnerabilities and remediation recommendations.

• **Vendor expertise:** Citrix Consulting combines deep knowledge and analytical skills with a fresh, objective viewpoint to uncover issues that you may be unaware of, or have overlooked.
