Reason 1: Provide secure access for all your workers, on all your apps, in this three-step plan, easily managed through Citrix Cloud.

Why this matters:
Some of your apps, and some of your workers, may still be operating outside the secure protection of your Citrix DaaS or VDI solution.

Result:
Your workforce has secure—and reliable—access to their apps at all times.

Reason 2: Replace your VPN with ZTNA.

Why this matters:
VPNs can create bottlenecks that degrade performance for your remote workers, who then choose to log off and access their apps via non-secure alternatives instead.

Result:
IT can spend their time on strategic compliance rather than due to day management, manual tasks, or cortisol issues.

Reason 3: Secure your contractors and other third parties easily.

Why this matters:
Contractors can be growth multipliers for your organization, but doing so insecurely can cost you.

Result:
IT can easily provide access to wherever it’s needed, while protecting your organization against insider threats and data loss.

Secure a consistent experience for all your people, on all their apps, and simplified management for IT.
