Citrix® NetScaler AppFirewall™ is a comprehensive full function ICSA, Common Criteria, FIPS-certified web application firewall that analyzes all bi-directional traffic, including SSL-encrypted communication, to protect against a broad range of security threats. It provides the ability to perform deep-packet inspection of HTTP, HTTPS and XML as well as protection against OWASP top 10. NetScaler AppFirewall threat protection includes and is not limited to SQL injection attacks, cross-site scripting attacks, cookie tampering, form validation and protection, HTTP and XML reply and request format validation, JSON payload inspection, signature and behavior based protections, data loss prevention (DLP) support including the monitoring of traffic for intended and unintended data exposure, DoS protection, authentication, authorization and auditing support and reporting, and policy tools that provide for easier PCI-DSS compliance verification.

NetScaler AppFirewall technology is included in and integrated with Citrix® NetScaler® MPX and VPX, Platinum Edition, and is available as an optional module that can be added to NetScaler MPX appliances running NetScaler Enterprise Edition. NetScaler AppFirewall is also available as a stand-alone solution on several NetScaler MPX appliances. The stand-alone NetScaler AppFirewall models can be upgraded via software license to a full NetScaler Application Delivery Controller (ADC).

We also have a cloud-based service through NetScaler Web App Security Service® that protects customers' web applications and infrastructure from cyber security attacks.

Addressing security challenges
Not only are web applications vulnerable to attack, they are attractive targets for hackers because they often have direct connectivity with one or more databases containing sensitive customer and company information. Threats against web applications are often devised specifically for a target application, making threat identification by network-level security devices (e.g., intrusion protection systems and network firewalls) impossible—leaving web applications exposed to a myriad of known and zero day exploits. NetScaler AppFirewall comprehensively addresses the challenge of delivering centralized application-layer security for all web applications and web services.

Hybrid security model
NetScaler AppFirewall enforces both positive and negative security models to ensure correct application behavior. The positive security model understands good application behavior, and treats all other traffic as malicious. This is the only proven approach delivering zero-day protection against unpublished exploits. Scanning of thousands of automatically updated signatures provides protection against known attacks.

Meeting PCI compliance and auditing requirements
NetScaler AppFirewall aids corporate IT security teams in conforming to governmental privacy regulations and industry mandates. For example, organizations subject to Payment Card Industry Data Security Standard (PCI-DSS) requirements can now fully meet the requirements detailed in PCI DSS Section 6.6, which mandates the...
installation of web application firewall in front of public-facing applications as one method of maintaining a proper security posture. In support of PCI security audits, NetScaler AppFirewall can generate dedicated reports detailing all security protections defined in the application firewall policy that pertain to PCI requirements. In addition, NetScaler AppFirewall prevents the inadvertent leakage or theft of sensitive information, such as credit card numbers or custom-defined data objects, by either removing or masking content from application responses—before being publicly disclosed.

**Defeating XML-based threats**

In addition to detecting and blocking common application threats that can be adapted for attacking XML-based applications (i.e., cross-site scripting, command injection, etc.), NetScaler AppFirewall includes a rich set of XML-specific security protections. These include schema validation to thoroughly verify SOAP messages and XML payloads, and a powerful XML attachment check to block attachments containing malicious executables or viruses. Automatic traffic inspection methods block XPath injection attacks on URLs and forms aimed at gaining access. NetScaler AppFirewall also thwarts a variety of DoS attacks, including external entity references, recursive expansion, excessive nesting and malicious messages containing either long or a large number of attributes and elements.

**Tailoring security policies**

NetScaler AppFirewall incorporates an advanced and proven adaptive learning engine that discovers aspects of application behavior that might be blocked by the positive security model even if the behavior is intended by the web application. This would include, for example, modifications made by client-side application scripting that legally modifies HTML form fields. Once application behavior is learned, NetScaler AppFirewall generates human-readable policy recommendations, which bring to security managers a clearer understanding of actual application behavior. Tailored security policies may then be applied to each application.

**Industry-leading performance**

NetScaler AppFirewall provides high capacity application security throughput to meet the needs of even the largest networks. In addition, the solution can actually improve application performance and lower response times by offloading compute-intensive tasks, such as TCP connection management, SSL encryption and compression from web servers. In addition, the integrated caching functionality available on the NetScaler platform offloads the servers while still applying full firewall functionality. Freeing valuable server resources improves the overall application experience.

**IP Reputation Service is Built-In**

NetScaler IP Reputation Service is built-in into NetScaler. This service is available at no extra cost with NetScaler AppFirewall solution. No service contract, no yearly renewals necessary.

NetScaler IP Reputation Service provides a continuously updated list of malicious IP addresses in near real-time, providing an additional layer of protection and helping to reduce the burden on security teams. Rather than relying on static, rapidly out-of-date public black lists, the NetScaler IP Reputation service automatically analyzes and correlates feeds from millions of global sensors in real-time and is updated every five minutes.

**Flexibility to adapt to changing business requirements**

NetScaler AppFirewall permits flexible, stepwise deployment of web application protection. The default web application protection profile defends against the most common dangerous threats and adds full protection against both data theft and layer 4-7 denial of service (DoS) attacks. The advanced web application protection profile adds session-aware protections to protect dynamic elements, such as cookies, form fields and session-specific URLs. Attacks that target the trust between the client and server including cross-site request forgery are stopped; requests are validated by checking for a unique ID inserted by NetScaler. Such protection is imperative for any application that processes user-specific content, such as an e-commerce site. To make sure these
security measures are compatible with any application, NetScaler AppFirewall learning capabilities help the administrator create managed exceptions and relaxations when the application’s intended—and legal—behavior might otherwise cause a violation of the default security policy.

**NetScaler Web App Security Service**

NetScaler Web App Security Service is a cloud-based service that protects customers’ web applications and infrastructure from application and network level attacks. It has historical retention capabilities for easy operation and incident analysis. Features include:

- Comprehensive Security: Protection against web application attacks using signatures, blacklisted and whitelisted URLs/applications, IP Reputation etc, and helps maintain compliance
- Fast Deployment: Click & Protect with NetScaler Web App Security Service — less than 5 clicks from first time login to protection
- Ease of Use: Quick and easy to deploy, manage, and create reports using a simplified GUI

Note: The above models are available as stand-alone NetScaler AppFirewall solutions. Additional application firewall support is provided as an integrated module within NetScaler VPX 10, 200, 1000 and 3000 virtual appliances and all NetScaler MPX Application Delivery Controller (ADC) hardware platforms.
Technical aspects

**Protects online revenue sources**
- Buffer overflow
- CGI-BIN parameter manipulation
- Form/hidden field manipulation
- Forceful browsing protection
- Cookie or session poisoning
- Cross-site scripting (XSS)
- Cross-site request forgery
- Command injection
- SQL injection
- Error triggering sensitive information leak
- Insecure use of cryptography
- Server misconfiguration
- Back doors and debug options
- Rate-based policy enforcement
- Well-known platform vulnerabilities
- SOAP array attack protection
- Content rewrite and response control
- Content Filtering
- Authentication, authorizing and auditing
- L4-7 DoS protection

**Comprehensive web server and web services security**
- Deep stream inspection; bi-directional analysis
- HTTP & HTML header and payload inspection
- Full HTML parsing; semantic extraction
- Session-aware and stateful
- HTTP Signature scanning
- Scan thousands of signatures
- Response side checks
- Protocol neutrality
- HTML form field protection:
  - Required fields returned; no added fields allowed;
  - read-only and hidden field enforcement
  - Drop-down list & radio button field conformance
  - Form-field max-length enforcement
- Cookie protection — Signatures to prevent tampering;
  cookie encryption and proxying
- Legal URL enforcement — Web application content integrity
- Full SSL offload:
  - Decrypts traffic prior to inspection; encrypts traffic
  - Configurable back-end encryption
  - Support for client-side certificates
- XML data protection:
  - XML security: protects against XML denial of service
    (xDoS), XML SQL and Xpath injection and cross site
    scripting
  - XML message and schema validation, format checks,
    WS-I basic profile compliance, XML attachments check
- URL transformation
- WSDL scan prevention to protect unpublished APIs
- Support for Chunked PDST requests

**Simplified management and deployment**

**user interface**
- Secure web-based GUI
- SSH-based CLI access network management
- SNMP
- Syslog-based logging
- PCI-DSS compliance reporting tool
- AppExpert Templates for Web Interface and Microsoft
  SharePoint
- Import/export Application Firewall profiles
- Convert third party application vulnerability tool output
  to NetScaler rules
- Quick deployment of new rules from Common Event
  Format (CEF) logs
