DELIVER BUSINESS RESULTS

- Send and receive sensitive data with encryption
- Support your HIPAA compliance for confidential PHI with a private enclave dedicated to healthcare
- Boost data security and gain IT control of how PHI is stored, accessed and shared
- Improve employee productivity via instant access to data and personalized desktops from any device

2015

THE YEAR OF THE HEALTHCARE HACK – AND IT'S ONLY GOING TO GET WORSE

Most breaches of data from health organizations are small and don't involve hackers breaking into a company's computer system. They involve a stolen laptop, a lost mobile device, emailing patient information with no encryption and employees sharing files via unauthorized file sharing tools. Healthcare organizations are turning to secure, enterprise file sharing services from Citrix ShareFile.

Support HIPAA Boost security Mobilize data access

You have the systems and policies in place to ensure you don't have a data breach, but those systems may not work well with one another or even be easy to use. Your providers want to use their own devices, and your administrative professionals are wasting a lot of time faxing, scanning and shredding paper. Or even worse, many Healthcare professionals are probably using insecure data methods without your knowledge.

How can you solve these problems? With ShareFile, you get secure file sharing that supports your HIPAA compliance and IT gains control of how data is accessed, stored and shared. You can even send extremely large files outside your network without hitting file-size limits. Healthcare professionals can send files directly from your EMR system or medical equipment to ShareFile, avoiding any PHI on local devices. Once files are in ShareFile, you can send them to patients, third parties and other providers by secure email — all in a way that keeps your data and your practice safe.
