

6 reasons to consolidate your EUC platforms

You probably didn't plan to operate both Citrix and Omnisca (formerly VMware End-User Computing), but because of M&A, departmental choices, failed migrations, or another situation, that's now your reality. Whatever the reason, you're now being forced to duplicate licenses, duplicate infrastructure, and duplicate operational management — and you have a higher risk and cost profile than you'd like because of it.

This side-by-side comparison shows why consolidating on Citrix is the smart decision for infrastructure and operations leaders looking to reduce risk and cut costs.

Omnisca

Stable vendor relationship

1

Remains the VDI/DaaS industry leader* in its fourth year post-acquisition, offering predictable pricing and a defined roadmap

Operational instability after its recent acquisition has resulted in pricing and roadmap uncertainty

TCO reduction

2

Lower TCO with a single platform license that includes consulting services and support, plus such capabilities as an enterprise browser, an ADC with WAF, a hypervisor, endpoint management, and more

Higher TCO due to paying for multiple licenses to gain full platform functionality, plus paying additional for consulting services, support, and point solutions to augment lacking capabilities

Infrastructure cost reduction

3

Greater host density reduces compute costs and associated storage costs, and optimized bandwidth consumption reduces networking costs

Less mature architecture and multi-session support do not optimally reduce the resource footprint of each VM and the associated storage and networking costs

High performance

4

Industry-benchmark protocol for superior performance over challenging network conditions, a result of decades of focused investment

Capable protocol but lacks the maturity to perform in real-world, high-latency and low-bandwidth scenarios

Deployment flexibility

5

Compatible with every major public cloud and the most common on-premises hypervisors, including VMware ESXi, Microsoft Hyper-V, Nutanix AHV, and its own Citrix XenServer

Compatible with the VMware vSphere, ecosystem including the VMware ESXi hypervisor, but not with all major public clouds and the most common hypervisors

Superior end-user experience

6

High-definition, customizable end-user experience enables productivity for a distributed workforce, even over unreliable network conditions

Not ideal for deep customization of the end-user experience, a geographically dispersed workforce, or high performance over variable network conditions

Because any migration carries risk, Citrix is offering consulting services and support for no additional cost.**

Review third-party validation of Citrix capabilities

*Citrix ranked highest in Gartner® Critical Capabilities for Desktop as a Service — three years in a row.
